

Victor® Gopher Trap

Instructions

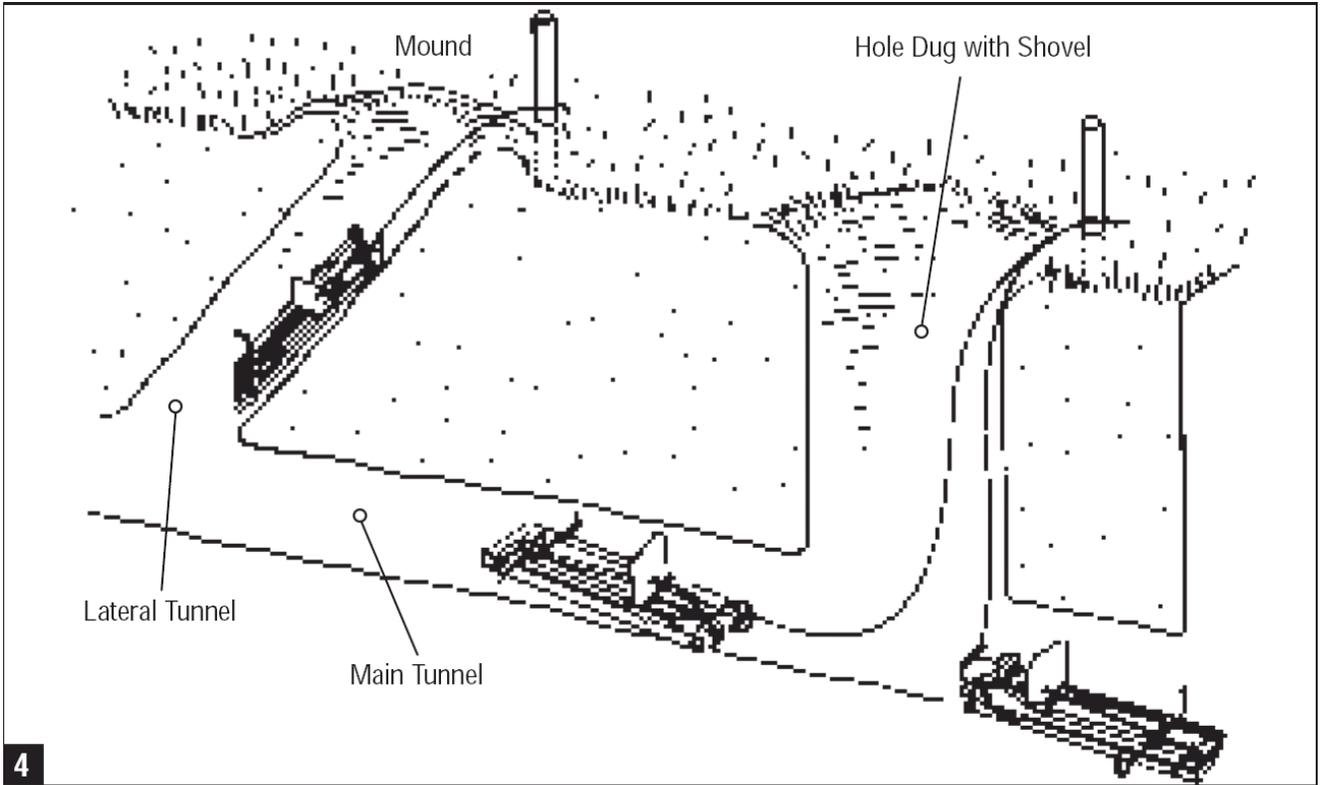

To locate tunnels in frequent use, clear away a mound of soil and probe for the opening usually a short passage that leads down a few inches to the main tunnel.

To Set the Gopher Traps:

1. Hold the trap in one hand, and with the fingers of your other hand, lift up trigger bar "A" to an almost vertical position. Slide thumb under trigger bar "A" (Illustration 1).
2. With thumb positioned behind jaws "B," press down on upper frame (arm) "C" until dog of trigger bar "A" engages over front of upper frame "C" (Illustration 2).
3. With thumb of other hand, press down on open end of trigger bar "A" to hold trap set, and engage pan "E" over end of trigger bar (Illustration 3).

4. **Lateral Tunnel Near Mound** (Illustration 4) - This is the least damaging to your lawn and easiest to dig. Locate mound and remove plug. Remove enough dirt from lateral tunnel to make a clean insertion of set trap. A small digging trowel works well. Install ground stake and attach trap. Set and insert trap. Cover hole as shown. **IMPORTANT:** Leave a small opening into the tunnel so light may be seen from inside. This will serve as "bait" for the gopher to come and repair the damage to the plug.

Caution: When setting or handling set gopher traps, keep fingers away from jaws. Keep gopher traps away from children and anyone unfamiliar with their use.
